

Templates as affixation of segment-sized units: the case of Southern Sierra Miwok

Eva Zimmermann (University of Leipzig)

The 38th Meeting of the Berkeley Linguistic Society

February 12, 2012

Main Claim

- templatic effects in Southern Sierra Miwok (SSM) follow from affixation of moras and underspecified segments
- this avoids the assumptions of a syllabified X-Slots representation a previous analysis of SSM argue for (Sloan, 1991)

**Affixation of segment-sized phonological elements predicts
'templatic effects' over whole strings of segments**

Southern Sierra Miwok

(1) *Miwokan (Penutian) family tree*

- 7 speaker in 1994 (Hinton 1994)
- described in Freeland (1951) and Broadbent (1964)
- analyses of lengthening phenomena in Sloan (1991), Brown (2004)

‘Templates’ in SSM

- (2) a. halɨk-iH-hɨY-ʔ (Sloan 1991, pp.152-154)
 ‘he used to hunt’
- b. halik-meh-nY-haHk-te-ʔ
 ‘I was hunting on my way’
- c. halki-paH
 ‘a good hunter’
- d. haɨlik-teɨ-nY
 ‘to hunt along the trail’

- many suffixes in SSM require that the roots to which they attach must conform to a particular shape: **template-requiring affixes**
 (cf. also Yawelmani, e.g. Archangeli 1984, 1991)

Templates-requiring affixes

(3) *Examples for template-requiring affixes*

Suffix	Gloss	Template requirement
-h	‘transitional’	CVC
-ksY		CVCV
-lVmh	‘to be ready to...’	CVCCV
-iH	‘habitual’	CVC:VC
-pa		CVCV:C
-ny		CV:CVC
-peH	‘agentive’	CVCVC
-j	‘verbalizer’	CVCV:

Three classes of LH-requiring affixes

(Sloan 1991, pp.172-177)

(4) *Affix -peH 'agentive'*

- | | | |
|----|-----------|---------------|
| a. | halik-peH | 'hunter' |
| b. | ʔokoj-peH | 'a nurse' |
| c. | liwaʔ-peH | 'speechmaker' |
| d. | kotoʔ-peH | 'guide' |

class I
 → CVCVC

(5) *Affix -t 'to do what is characteristic of ...'*

- | | | |
|----|---------|---------------------------|
| a. | wyli:-t | 'to flash, of lightening' |
| b. | paTy:-t | 'to take, accept' |
| c. | pulu:-t | 'to dip up' |
| d. | moli:-t | 'shade' |

class II
 → CVCV:

(6) *Affix -na 'benefactive'*

- | | | |
|----|----------|-------------------------|
| a. | kojow-na | 'to tell for someone' |
| b. | heka:-na | 'to clean for someone' |
| c. | juwal-na | 'to stir for someone' |
| d. | TeTy:-na | 'to gather for someone' |

class III
 → CVCVC or
 CVCV:

Three classes of LH-requiring affixes (Broadbent 1964, Sloan 1991)

(7) *LH templates: examples*

	followed by class I affix	followed by class II affix	followed by class III affix
Biconsonantal stems			
a. liw:a	liwaʔ	liwa:	liwa:
b. pe:l:e	peleʔ	pele:	pele:
c. ko:l	koluʔ	kolu:	kolu:
Three-consonantal stems			
e. wyliz:p	wylip	wyli:	wylip
f. halki	halik	hali:	halik
g. wyks	wykys	wyky:	wykys

- degemination, vowel shortening, consonant deletion, insertion of /y/ or /ʔ/, vowel lengthening or CV metathesis apply to ensure that the stem conforms to the templatic requirement

Various strategies to achieve LH template

(8) *Phonological changes*

example	meta.	+ ʔ	+ y	short.	C-del.	leng.	degem.
a. ʔamla ʔamal (I)	✓	✗	✗	✗	✗	✗	✗
b. wyks wykys (I)	✗	✗	✓	✗	✗	✗	✗
c. wyliz:p wylip (I)	✗	✗	✗	✓	✗	✗	✗
d. hela:ʔ hela: (II)	✗	✗	✗	✗	✓	✗	✗
e. hek:a hekaʔ (I)	✗	✓	✗	✗	✗	✗	✓
f. ho:ja hojaʔ (I)	✗	✗	✓	✓	✗	✗	✗
g. polat pola: (II)	✗	✗	✗	✗	✓	✓	✗
h. hek:a heka: (II/III)	✗	✗	✗	✗	✗	✓	✓
i. cy:m cymyʔ (I)	✗	✓	✓	✓	✗	✗	✗
j. cy:m cymy: (II)	✗	✗	✓	✓	✗	✓	✗
k. pult pulu: (III)	✗	✗	✓	✗	✓	✓	✗

Three LH templates in SSM

(9) *The three LH templates*

	biconsonantal stem	three-consonantal stem
class I requires	CV.CVC	CV.CVC
class II requires	CV.CV:	CV.CV:
class III requires	CV.CV:	CV.CVC

Representing the three LH templates?

- in standard moraic theory, light (μ) and heavy ($\mu\mu$) syllables are distinguishable but the difference between heavy CVC and CV: cannot be coded

The analysis in Sloan (1991)

- the need to distinguish C- and V-final stems (class I/II) is taken as an argument for X-Slot theory (Levin 1985): neither CV theory (McCarthy 1979, Marantz 1982) nor standard moraic theory (Hayes 89) is able to represent this adequately
- and the LH templates are represented as (partially) syllabified sequences of X-Slots

(10) *LH templates: representation in Sloan (1991)*

Avant: Iambic lengthening

(Callaghan 1978, Hayes 1995)

- main stress in SSM is always on the first heavy syllable and must be on the first or second
- only heavy syllables are stressable

LH templates as affixation of segment-sized units

- ① **Prefixation of a μ**
moraic overwriting: the first syllable is light
- ② **Suffixation of defective C/V segments in class I/II**
defective segments specified as C or V must be realized stem-final

A prefixed μ ...

- affixation of moras is proposed in various analyses of non-concatenative morphology
(e.g. Davis&Ueda 2002, Grimes 2002, Seiler 2008 or Zimmermann&Trommer 2010)
- must be realized at the left edge of the stem,
i.e. dominate the first vowel

A prefixed μ ...

- is the only possible μ in a syllable:

(11) $\text{DEPLINK-}\mu]_{\sigma}$ (e.g. Morén 1999 for $\text{DepLink}\mu$)
 Assign a violation mark for every inserted association line between μ and a segment that is not at the right edge of a syllable.
 (=DL])

- ‘inserted’ = an association line that was not present in the input
- this faithfulness constraint demands that modifications of the prosodic structure are preferred at the right edge of a syllable
 - ➔ prominence by position

Constraints ensuring realization of μ

MAX- μ

Assign a violation mark for every μ in the input without an output correspondent.

MAX- μ_{AF}

Assign a violation mark for every affix μ in the input without an output correspondent.

Prefixation of a mora

(12) *Moraic Overwriting*

	$\begin{array}{cccc} \textcircled{\mu} & \mu & \mu & \mu \\ & & & \\ \text{h} & \text{o} & \text{j} & \text{a} + \text{p} \text{e} \text{H} \end{array}$	MAX- μ_{AF}	DL]	MAX- μ
a.	$\begin{array}{ccc} \mu & \mu & \mu \\ & & \\ \text{h} & \text{o} & \text{j} \text{a} \text{p} \text{e} \text{H} \end{array}$	*!		*
b.	$\begin{array}{cccc} \textcircled{\mu} & \mu & \mu & \mu \\ & & & \\ \text{h} & \text{o} & \text{j} & \text{a} \text{p} \text{e} \text{H} \end{array}$		*!	
(\leftarrow) c.	$\begin{array}{ccc} \textcircled{\mu} & \mu & \mu \\ & & \\ \text{h} & \text{o} & \text{j} \text{a} \text{p} \text{e} \text{H} \end{array}$			*

(underlyingly unassociated μ are circled)

Constraints responsible for iambic lengthening

ALL-FT-L (McCarthy&Prince 1993)

Assign a violation mark for every left edge of a foot that is not aligned with the left edge of a prosodic word.

RHT:I (Kager 1993)

Assign a violation mark for every foot with non-final prominence.

STRESS-TO-WEIGHT (Kager 1999)

Assign a violation mark for every stressed syllable that is not heavy ($=2\mu$).

DEP- μ (e.g. Morén 1999)

Assign a violation mark for every μ in the output that has no input correspondent.

PARSE- σ (Prince&Smolensky 1993, McCarthy&Prince 1993)

Assign a violation mark for every syllable that is not parsed into a foot.

Iambic Lengthening

...and if the first σ is light, the second is necessarily heavy!

(13) *Iambic Lengthening in SSM*

μ + hojapeH	ALL-FT-L	RHT:I	Stress-to WEIGHT	DEP- μ	PRS- σ
a. ho ^{μ} (ja.peH)	*!		*		*
b. (hó ^{μ} .ja)peH		*!	*		*
c. (ho ^{μ} .já)peH			*!		*
d. (hó: ^{μ})ja.peH				*	**!
 e. (ho ^{μ} .já:)peH				*	*

(if an underlyingly unassociated μ links to an output segment: notated as X^{μ})

Defective C/V nodes...

- defective segmental root nodes are assumed to result in mutation, reduplication or insertion
(e.g. Bye&Svenonius to appear, Bermúdez-Otero to appear)
- in SSM, they have a minimal feature specification characterizing them as either obstruents/sonorants/glides or as vowel

(14) [+vocalic] (Padgett 2007, Nevins&Chitoran 2008)
=Absence of a narrow constriction among the articulators

(15) *Natural classes given [\pm cons] and [\pm +vocalic]* (Nevins&Chitoran 2007)

obstruents	[+cons][−voc][−son]
liquids, nasals	[+cons][−voc][+son]
vowels	[−cons][+voc][+son]
glides	[−cons][−voc][+son]
illicit	* [+cons][+voc]

Defective C/V nodes...

- specifications for the missing features are required by constraints like HAVEPLACE

(16) *Example: Representation for suffix class 1 /-pe:/*

●	●	●
	+cons	-cons
	-son	+son
-voc	-voc	+voc
	-cont	+cont
	-nas	-nas
	LAB	DORS

→ abbreviated as: $[-\overset{\bullet}{\text{voc}}]$ pe:

Defective C/V nodes...

- are realized

	as underspecified default segment, or	as fused segment
	$h_1o_2j_3a_4 + \overset{\bullet_x}{[-voc]}$ <p style="text-align: center;">↓</p> $h_1o_2j_3a_4?_x$	$p_1o_2l_3a_4t_5 + \overset{\bullet_x}{[-voc]}$ <p style="text-align: center;">↓</p> $p_1o_2l_3a_4t_{5,x}$
violates:	e.g. HAVEPLACE	UNIFORMITY

Defective C/V nodes...

- are part of the following suffix and must be realized at the right edge of the stem

- (17) O-CONTIGUITIY (=O-CONT) (Landmann 2002)
Assign a violation mark for every instance where phonological portions in the output that belong to the same morpheme do not form a contiguous string. ('No M-internal insertion.')

Constraints responsible for iambic lengthening

MAX-S_{AF}

Assign a violation mark for affix segment in the output without an input correspondent.

IDENT-[VOCALIC] (=ID-[VOC])

(McCarthy&Prince 1995+1999)

Assign a violation mark if an input segment corresponds to an output segment with a different value for [\pm voc].

HAVEPLACE (=HAVPL)

(e.g. Padgett 1995, McCarthy 2008)

Assign a violation mark for every segment that has no place specification.

UNIFORMITY (=UNIF)

(McCarthy)

Assign a violation mark for every output segment that corresponds to more than one input segment.

Demand to end in a C: realization of a default segment

(18) *Realization of a defective C*

$\mu + h_1o_2j_3a_4 + \overset{\bullet}{x} [-\text{voc}] p_ye_z$	MAX-S _{AF}	O-CONT	ID-[VOC]	HAVPL	UNIF
a. $h_1o_2^\mu \cdot j_3\acute{a}:_4 \cdot p_ye_z$	*!				
b. $h_1o_2^\mu \cdot j_{3,x}\acute{a}:_4 \cdot p_ye_z$		*!			*
c. $h_1o_2^\mu \cdot j_3\acute{a}:_{4,x} \cdot p_ye_z$			*!		*
 d. $h_1o_2^\mu \cdot j_3\acute{a}_4?_x \cdot p_ye_z$				*	

3.2. Satisfaction of the templatic requirement

Different phonological strategies apply
to ensure satisfaction of the templatic requirement

Summarizing the ranking

(19)

Moraic Overwriting results in LH

$\mu + \text{hek:a}$	ALL-FT-L	RHT:I	STRESS-TO WEIGHT	MAX- μ_{AF}	DL]	DEP- μ
a. hek:a				*!		
b. he^{μ}ka			*!			
 c. $\text{he}^{\mu}\text{ka:}$						*

Summarizing the ranking

(20)

C/V must be realized in final position

$\mu + \text{hoja} + \overset{\bullet}{x} [-\text{voc}] \text{peH}$	LH	MAX-S _{AF}	O-CONT	ID[VOC]	HAVPL	UNIF
a. $\text{ho}^{\mu}\text{japeH}$		*!				
b. $\text{ho}^{\mu}\text{j}_x\text{apeH}$			*!			*
c. $\text{ho}^{\mu}\text{ja}_x\text{peH}$				*!		*
 d. $\text{ho}^{\mu}\text{ja}^?_x\text{peH}$					*	*

Example I: Insertion of /y/

(21) *wyks realized as wykys before class I suffix*

μ + wyk ^s + [-voc] kuH	LH	C/V	HAVPL	UNIF	MAX-C	LIN
a.* wýks.kuH	Max!	Max				
b.* wý ^μ ks. _x kuH	DL]!			*		
c. wý ^μ k.sy? _x kuH	DL]!		**			
d. wy ^μ .kýs. _x kuH			*	*		

(Note that CCC cluster are independently impossible in SSM)

Example II: metathesis

(22) *ʔamla realized as ʔamal before class I suffix*

$\mu + \text{ʔamla} + \overset{\bullet}{x} \text{[-voc]} \text{kuH}$	LH	C/V	HAVPL	UNIF	MAX-C	LIN
a. $\text{ʔá}^\mu \text{m.l}_x \text{a.kuH}$	DL]!	Cont		*		
b. $\text{ʔá}^\mu \text{.l}_x \text{a.kuH}$	StW!	Cont!		*		
c. $\text{ʔá}^\mu \text{.la} \text{ʔ}_x \text{.kuH}$			*!		*	
 d. $\text{ʔa}^\mu \text{.mál}_x \text{.kuH}$				*		*

Example III: Shortening, insertion of /y/ and /ʔ/

(23) *cy:m realized as cymyʔ before class I suffix*

$\mu + \text{cy:m} + \overset{\bullet}{\text{x}}_{\text{[-voc]}} \text{kuH}$	LH	C/V	HAVPL	UNIF	MAX-C	LIN
a.* $\text{c}\acute{\text{y}}^{\mu} \text{m}_{\text{x}} \text{kuH}$	DL]!			*		
b. $\text{c}\acute{\text{y}}^{\mu} \text{m}_{\text{x}} \text{kuH}$	DL]!			*		
c. $\text{cy}^{\mu} \text{m}_{\text{x}} \acute{\text{y}} \text{kuH}$	StW]!	Cont!	*	*		
 d. $\text{cy}^{\mu} \text{m}_{\text{x}} \acute{\text{y}} \text{ʔ} \text{kuH}$			**			

(*CV:C syllables are independently impossible in SSM)

Example IV: C-Deletion

(24) *hela:j realized as hela: before class II suffix*

$\mu + \text{hela:j} + \overset{\bullet}{x} \text{ } [+voc] \text{ } t$	LH	C/V	HAVPL	UNIF	MAX-C	LIN
a. $\text{he}^{\mu}.\text{la:}xjt$		Cont!		*		
b. $\text{he}^{\mu}.\text{la:j}xt$		Id!		*		
 c. $\text{he}^{\mu}.\text{la:}xt$				*	*	

Lengthening suffixes in SSM

- recall that DEPLINK- μ] results in overwriting if a μ is prefixed
- but there are actually affixes that trigger lengthening, i.e. where a μ is apparently added to the stem!

(25) *Lengthening suffixes in SSM*

(Bradbent 1964:48, 106)

a. ?enup:eni:te-?

?enup:eni:te?

'I chased you'

b. kel:a-na:me?

kel:ana:me?

'It snowed on us'

Lengthening suffixes in SSM

(26) *A floating μ in the representation of a lengthening suffix*

	$\begin{array}{c} \mu \quad (\mu) \mu \\ \quad \\ \dots u \quad p + e \quad n \end{array}$	MAX- μ_{AF} DL]	MAX- μ
a.	$\begin{array}{c} \mu \quad \mu \\ \quad \\ \dots u \quad p \quad e \quad n \end{array}$	*!	*
 b.	$\begin{array}{c} \mu \quad (\mu) \mu \\ \quad \quad \\ \dots u \quad p \quad e \quad n \end{array}$		
c.	$\begin{array}{c} (\mu) \quad \mu \\ \quad \\ \dots u \quad p \quad e \quad n \end{array}$		*!

Moraic prefixes overwrite and moraic suffixes lengthen

(27)

	MAX- μ_{AF}	DL]	MAX- μ
Lengthening			
a.	$\begin{array}{c} \mu \quad \mu \\ \quad \\ \dots u \quad p \quad e \quad n \end{array}$	*!	*
b.	$\begin{array}{c} \mu \quad (\mu) \quad \mu \\ \quad \quad \\ \dots u \quad p \quad e \quad n \end{array}$		
c.	$\begin{array}{c} (\mu) \quad \mu \\ \quad \\ \dots u \quad p \quad e \quad n \end{array}$		*!
Overwriting			
a.	$\begin{array}{c} \mu \quad \mu \quad \mu \\ \quad \quad \\ h \quad o \quad j \quad a \quad p \quad e \quad H \end{array}$	*!	*
b.	$\begin{array}{c} (\mu) \quad \mu \quad \mu \quad \mu \\ \quad \quad \quad \\ h \quad o \quad j \quad a \quad p \quad e \quad H \end{array}$		*!
c.	$\begin{array}{c} (\mu) \quad \mu \quad \mu \\ \quad \quad \\ h \quad o \quad j \quad a \quad p \quad e \quad H \end{array}$		*

Conclusion

- templatic effects in Southern Sierra Miwok (SSM) are the consequence of the affixation of moras and underspecified segments
- this analysis is based exclusively on the affixation of segment-sized units and avoids the assumptions of syllabified X-Slot positions in the representation of morphemes
- this unifies analysis for templatic effects with the analysis of other lengthening phenomena in the language that are based on the assumption of floating moras as well
